

Pension Saral

Minute one is the journey, shown as a citizen. Minute two is why it is built this way, and exactly what is real.

0:00 - 1:00 the journey 1:00 - 2:00 why, and what is mocked ≈ 300 words spoken

Before you press record

Read the script slower than feels natural. Judges are watching forty of these in a row; the pauses are what make it land.

- ☐ Open `/demo`, or press Ctrl + Shift + D from any screen.
- ☐ Set the result to **Decide honestly** and the speed to **8 seconds**.
- ☐ Press **Fill the form with the demo pensioner**.
- ☐ Go to `/`, choose English, and close `/demo`.
- ☐ Browser at 1280 × 800, zoom 100%, bookmarks bar hidden.
- ☐ Second tab already sitting on `/about` — you cut to it at 1:45.
- ☐ Record the screen first, lay the voiceover over it after. Talking and clicking at once is what makes these look nervous.
- ☐ If the site was just deployed, load a page and wait. The pension office is an in-memory store and a cold start can lose a record mid-journey.

ACT ONE

The journey

0:00 → 1:00

0:00 / — the language screen. Tap हिन्दी, let it load, then come back and pick English so the rest is readable.

Every year, more than one crore Indian pensioners have to prove they are alive, or the money stops. But that is only the last step of a pension.

0:08	○ /start — the hub. Hover each of the three cards so the schemes inside them are visible.	Before it there is applying, and after it there is everything that goes wrong. Fourteen government schemes, behind one door.
0:16	○ I am not sure which one. Answer: start a pension → neither of those → 60 or more → my husband has died.	Nobody's portal answers the question people actually have — which pension am I entitled to. Four questions, in plain words.
0:30	○ It lands on Widow pension . Scroll slowly: who it is for, how much, who decides, and the six real stages.	It names the scheme, what she will get, and who decides — the village office, the gram sabha, the Collector. Before she starts.
0:40	○ Start this → I am helping a family member → the eligibility checks → Next .	Helping a parent is a mode, not a lie she has to tell. And the checks come before the form, not after twenty fields.
0:48	○ Documents step. Press Take a photo on the death certificate.	Photograph the paper. Nobody in a village has a scanner.
0:54	○ Details → Send code → the code appears on screen → Check the code → photo → Send .	One screen, and the code arrives in place. She never leaves the page.

Do not rush the camera. The coaching line turning from rust to green is the best three seconds in the video — let it breathe.

- 1:00 ○ The status timeline, walking: village office → gram sabha → taluka → Collector. Let it run.
- 1:12 ○ The receipt: ₹1,050 a month, the order number, the first payment date.
- 1:22 ○ /demo → **Always needs fixing** → run any journey → on the result, expand **Technical details**.
- 1:34 ○ Open **Extra pension after 80** with the demo pensioner. Rest the cursor on the arrears figure.
- 1:45 ○ Cut to /about. Scroll the real-versus-mocked table, then the service map beneath it.
- 1:55 ○ End on the hub, or back on the language screen.

Now the part that matters. Not a spinner — the real approval chain, and who is holding her file right now. A person who can see it is sitting at the taluka office knows who to ring.

And a receipt she can show her son. For a new pension the big number is the money. For the yearly renewal it is a date. She gets what she came for.

When something fails, never the word rejected. One sentence on what happened, one on what to do, one button. The raw code is here, for you — invisible to her.

AI does three small jobs and is never the pitch. It explains a code in her language, and checks her photo before it is sent. It never decides an outcome — a wrong guess costs one retake, never a pension.

Here is exactly what is real and what is not. Every scheme is mapped to the government system it stands for. Aadhaar, the one-time code and the face match are mocked. The journey, the state machine and both AI calls are not.

A pensioner should never be stuck, confused, or silently rejected. That is the whole product.

If you overrun

Cut in this order. Each is the least load-bearing thing left.

- 1 **The language toggle at 0:00.** Start in English and say “three languages” over the hub instead. Saves 6 seconds.

2 The 80+ arrears at 1:34. Say the AI line over the /about scroll. Saves 11 seconds.

3 The service-page scroll at 0:30. Land on it, read the title, move on. Saves 6 seconds.

Do not cut the finder, the status timeline, or /about. Those three are the product, the engineering, and the honesty criterion.

If you have room left

The same journey on a bad connection

/demo → **Pretend the network is slow**, then send something. Nothing breaks and nothing spins forever.

+8s

The question almost nobody is asked

Family pension asks first whether her name is already in his PPO — because if it is, the bank can start paying with no office visit. Six weeks becomes one.

+10s

Numbers you can quote

All of these are true of the build as it stands. None is rounded up.

Services	14, each mapped to a real scheme and its real form
Languages	3, complete – 739 strings each, checked by a linter
Widow pension in the demo	₹1,050 a month, six approval stages
80+ arrears, demo pensioner	₹77,280 owed since 1 Nov 2024, at 20%
First-load JavaScript	≈115 KB – only the chosen language is sent
Contrast	Every text pair at WCAG AAA
With the AI key removed	Still works – every call has a hardcoded fallback
Built with	OpenAI Codex and Claude, from one written specification

Three lines worth keeping in

Say at least one of these out loud. Honesty is a judging criterion, not a footnote.

“The AI never decides an outcome. It explains one the government system already returned.”

“The pension office here is a mock. It is a real state machine with a real audit log — but it is ours, not the government's.”

“We built this with Codex and Claude, from one written specification. The two AI features in the product run on an OpenAI model, and both have a written fallback — so it works with the key pulled out.”

On the day

Never Say **biometric, authentication, verification** or **rejected**. The app refuses those words, and the contrast is the point.

Never Crop out the banner across the top. It says this is a student prototype, and it belongs in every frame.

Do Show one journey properly rather than four badly.

Do Let the eight-second wait actually play. Cutting it away removes the proof that the backend is real.
